

HUMAN URINARY COLLAGEN IV EIA

Collagen IV is a major structural component of the renal glomerular basement membrane and mesangial matrix and its increased deposition is directly related to the pathogenic processes associated with several chronic renal disorders, including progressive diabetic nephropathy but also non-diabetic and chronic transplant nephropathies. Increased Urinary Collagen IV concentration is indicative of the extent of renal morphological abnormalities and is an excellent indicator of the severity of disease progression.

Applicable Areas:

"Diabetic nephropathy",

"Chronic kidney disease",

"Chronic transplant nephropathy",

"Glomerulonephritis".

1

Non-invasive collection

2

User-friendly assay procedure

3

Accurate & sensitive results

AN ACCURATE BIOMARKER FOR MONITORING FIBROSIS AND GLOMERULAR INJURY IN CKD

Accurate and reliable quantification of Urinary Collagen IV levels

Strong scientific and clinical validation

Rapid non-invasive sampling

Only 50µL of human urine required

ACTIF JAPAN
